

# ETL - Design & Implement Data Warehouse

Learn how to design, implement, and optimize a data warehouse.

Drive business intelligence and decision-making using ETL processes. This presentation covers the key steps involved in creating an efficient data warehouse.

a

# Understanding ETL

ETL (Extract, Transform, Load) is a fundamental data management process.

## 1 Extract

Collecting data from various sources, APIs. data for analysis.

## 2 Transform

Cleaning, organizing, and processing as a data warehouse.

## 3 Load

Storing data in the target system, such such as databases and

# Star Schema Vs. Snowflake Schema

Understanding the key differences between Star and Snowflake Schemas. This helps to structure your data warehouse effectively.

## Star Schema

- Central fact table.
- Directly connected dimension tables.
- Faster query performance.

## Snowflake Schema

- Hierarchical dimensions.
- Saves storage space.
- Complex queries.

# Choosing a Business

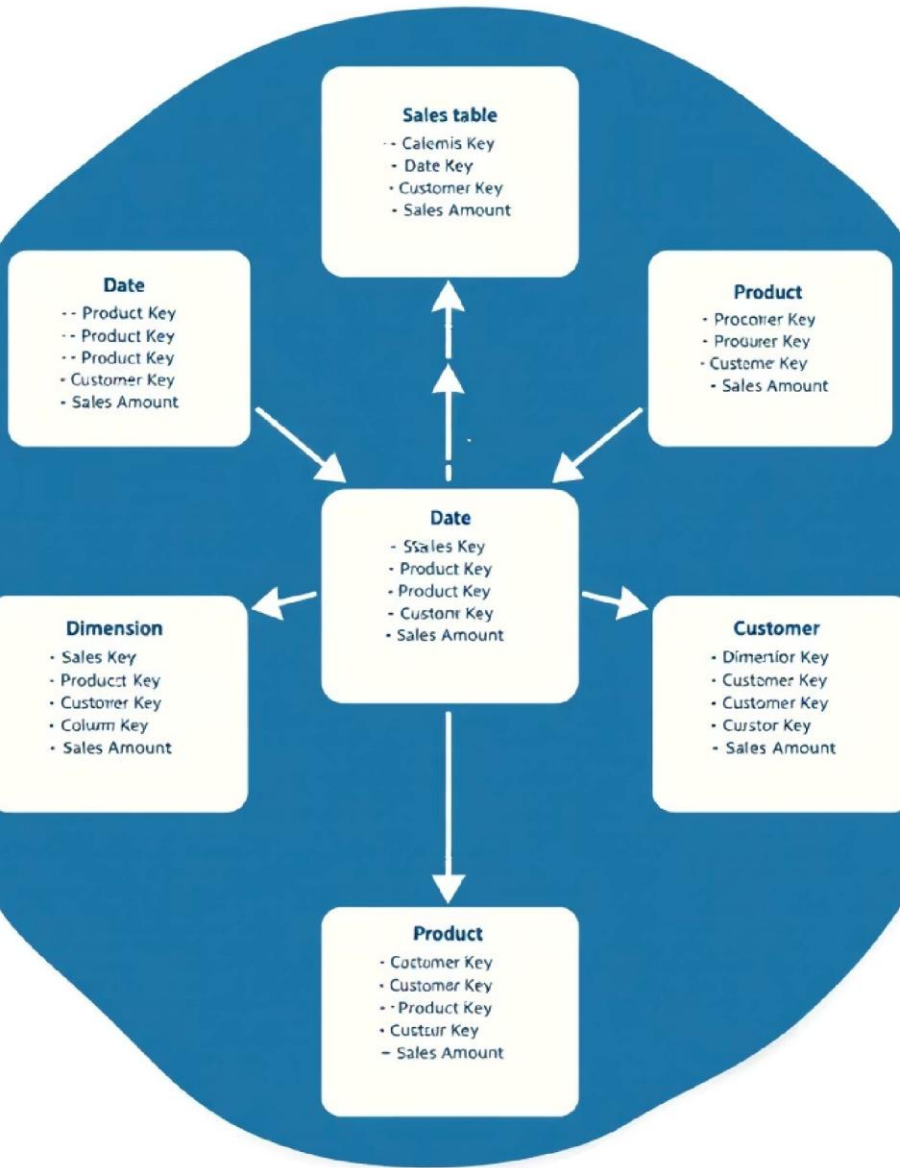

Fashion boutique owned by an independent designer.

Case

Fact schemas table

Customer

Product

Order

Employees

Payments

Purchases

# Implementing a Star Schema

Star Schema Implementation.

1

Fact Table

"Purchase Records"

2

Dimension Tables

Products, Employees, Orders, Payments, Customers.

## Insights and Conclusions

Communication among team members was crucial.

## Standardized Codes

Identification codes across tables.

## Consistent Naming

Table and column names for Foreign-Key relationships.

## Table Order

Dimension tables first, followed by the fact table.

# Thank You

Thank you for listening. Sapir, Anan and Tomer.
